
Software testing is a process by which software is examined and evaluated for its quality and safety. It regularly makes sure that a product satisfies customer needs, minimizes risk to the end users, and meets other important objectives. This article attempts to introduce software testing principles, techniques and tools to those who want an overview of these concepts. It also includes the benefits of software testing as well as some definitions of terms such as Regression Testing, Test Design, Test Case Management etc. Software testing is a process by which software is examined and evaluated for its quality and safety. It regularly makes sure that a product satisfies customer needs, minimizes risk to the end users, and meets other important objectives. In the procurement phase, a contractor is shortlisted for the task of writing software based on certain requirements. The procurement process consists of research, analysis, design, development and testing phases. In each phase, there are several tests that take place before the end product is delivered to the customer. These tests are carried out to prove that all requirements have been met satisfactorily during each stage of development. This ensures that there are no defects in the end product. Also see "software testing". Software testing is done at various levels to ensure that the software meets the quality standards. Various techniques are used to test various operational aspects of the software. The technique used depends on various factors such as time, cost, resources available etc. A matrix of these factors is used to determine which test method should be used to achieve maximum test coverage. Various methods of testing are listed below:

Also see "software testing". The primary objectives of testing are:

Also see "software verification". Verification ensures that a product meets its intended requirements. It also verifies that the product satisfies customer needs/quality standards/safety standards/etc. It is an important part of the software development life cycle. Verification has several components. These include:

Software testing is a process that aims at assessing the quality and safety of software products. It can be considered as a support activity to other activities such as requirements analysis and design, system specification and development. The main objective is to ensure that the software product meets required standards before it reaches the customer, thus improving its chances for success in the market and decreasing the total cost of ownership (TCO). Software testing encompasses all activities occurring after functional verification and formal testing, but before release or deployment. It encompasses activities preceding acceptance testing such as analysis, design and specification. Also see "software testing". It is hoped that the evaluation of the software product will guarantee its safety and hence increase buy-in by customers. Software testing is an activity that aims at assessing the quality and safety of software products using various test techniques. It can be considered as a support activity to other activities such as requirements analysis and design, system specification and development. The main objective is to ensure that the software product meets required standards before it reaches the customer, thus improving its chances for success in the market and decreasing its total cost of ownership (TCO). Software testing encompasses all activities occurring after functional verification and formal testing, but before release or deployment. It encompasses activities preceding acceptance testing such as analysis, design and specification. Also see "software testing".
